Education

Bachelor of Science in Computer Science Judy Genshaft Honors College	University of South Florida	Expected May 2027 GPA: 3.8/4.0
--	------------------------------------	--

Professional Experience

Technology Summer Analyst	Citi	May 2026 – Aug 2026
- Built an internal engineering productivity analytics platform using React, TypeScript, and FastAPI, surfacing workload, incident trends, team capacity, and historical performance metrics now used by engineering leadership - Integrated operational data from Jira and ServiceNow to support ticket distribution analysis, engineer-level drill-downs, and configurable historical reporting across multiple time ranges - Engineered backend services and interactive analytical workflows with FastAPI, including filtering, drill-down views, and workload reporting across engineering activity data - Translated stakeholder requirements into a production-ready analytics solution, iterating directly with engineering leadership through development, presentation, and adoption		
Software Engineer, Mobile	University of South Florida	Jan 2025 – Present
- Engineered an Android application for driving behavior research, enabling participant authentication and GPS data collection for an active study with 50 participants - Architected C# services for GPS tracking, speed computation, and route data collection using Unity and Android SDK - Designed Supabase-backed authentication and data persistence workflows to manage participant records and research data		
Software Systems Engineer Intern	Moffitt Cancer Center	May 2025 – Present
- Automated extraction and normalization of multi-vendor genomic patient reports using Python (Regex, Pandas), eliminating manual preprocessing and reducing processing time by 60% - Designed structured data pipelines to standardize mutated gene, TMB, and MSI fields across heterogeneous schemas, improving dataset consistency for 10,000+ records - Built reusable Python and R scripts for validation, analysis, and visualization across heterogeneous genomic datasets		
Data Engineering Intern	Purdue University	Jan 2025 – Dec 2025
- Engineered Python, SQL, and Pandas pipelines to clean, transform, and analyze AI-in-education research data - Applied the Self-Regulated Learning (SRL) framework to identify behavioral trends across qualitative and quantitative datasets - First-authored peer-reviewed research on generative AI in engineering education, published and presented at the 2026 ASEE Annual Conference & Exposition		
Backend Software Engineer Intern	Telecommunications Ltd.	May 2024 – Aug 2024
- Reduced API endpoint latency by 35% by optimizing SQL queries and refactoring Express.js logic for internal dashboards - Supported 500+ employees by building and maintaining high-availability Node.js and Express.js backend services - Accelerated deployment cycles by 40% by containerizing services with Docker and CI/CD pipelines using GitHub Actions - Designed RESTful APIs and PostgreSQL schemas to support real-time monitoring of high-volume operational data		

Projects

AI Workflow Orchestration & Incident Intelligence Platform Python, FastAPI, PostgreSQL, pgvector, React, Docker		
- Built a DAG-based AI workflow engine that orchestrates LLM calls, vector retrieval, conditional logic, HTTP requests, and Python functions across multi-step workflows - Engineered a PostgreSQL-backed job queue for asynchronous workflow execution, coordinating concurrent workers with persistent state, failure isolation, and per-node retries - Developed an AI incident analysis system that retrieves similar incidents and runbooks with pgvector and produces evidence-backed root-cause hypotheses and remediation recommendations		
Music Therapy Research Platform Kotlin, Jetpack Compose, Firebase, Firestore, Media3 (ExoPlayer), MVVM		
- Engineered a native Android application for music therapy research, enabling participant enrollment, session management, and structured playback workflows for elderly patient studies - Designed a Firestore data model with hierarchical session and segment records to support synchronization of music playback events with EmotiBit physiological data for downstream Python analysis		

Technical Skills

Languages: Python, Java, Kotlin, C#, JavaScript, TypeScript, SQL Frameworks & Libraries: React.js, Node.js, Express.js, FastAPI, Jetpack Compose, Media3 (ExoPlayer), Pandas, NumPy Databases & Cloud: PostgreSQL, pgvector, Firebase Firestore, Firebase Authentication, Supabase, SQLite, Docker, AWS Developer Tools: Git, GitHub Actions, Jira, ServiceNow, Tableau, Unity, Android SDK, Vercel Software Engineering: REST APIs, MVVM, AI Workflow Orchestration, RAG, Vector Search, Concurrent Processing, CI/CD, Data Pipelines, Agile/Scrum
